Q1 On average, how many equations per article are published in each journal? (Hint: use $group_by()$ and summarise())

```
EquationCitations %>%
  group_by (journal) %>%
  summarize(promedio = mean(equations))
```

Q2 For each journal, calculate the average proportion of theoretical citations relative to total citations. (Hint: create a new column with mutate(theo_ratio = theocites / cites), then group_by() and summarise()) ## Para cada revista, calcule la proporción promedio de citas teóricas respecto al total de citas. (Sugerencia: cree una nueva columna con mutate(theo_ratio = theocites / cites), luego group_by() y summarise())

```
EquationCitations %>%
  mutate(theo_ratio = theocites / cites) %>%
  group_by(journal) %>%
  summarise(citaspromedio = mean(theo_ratio))
```
